

## **Acquired Rectovaginal Fistula in Job's Syndrome**

Muin Al-Habashneh, MD\*

Issa Hijazi, MD\*

**A 6 month old female patient admitted to King Hussein Medical Center with 2 weeks history of fecal discharge from lower labia, found to be a result of acquired rectovaginal fistula. Patient had a previous history of reluctant eczematous dermatitis and recurrent skin abscesses. The diagnosis of hyper IgE syndrome was made on basis of recurrent infections and a very high level of IgE. To the best of our knowledge this is the first case of proved hyper IgE syndrome presenting with rectovaginal fistula.**
