Eyad Alqasim, MD* Rashid Kameshki, MBBS** Maged Mostafa, MD***

A patient presented with wrist painless mass, the superficial branch of radial nerve was overlying the mass. The mass was removed surgically and the numbness disappeared postoperatively.

Ganglion cyst is a very common soft tissue condition. Its etiology remains not very well understood. The usual size is about 1-2 cm, but some atypical cysts exist. A comprehensive knowledge of the regional anatomy together with good preoperative diagnostic technique is essential for their safe excision particularly in those with unusual presentation.
