INTRODUCTION

Adult-onset Still's disease (AOSD) is considered to be one of the rare systemic inflammatory disorders with unknown causes. Characterized by fever, arthritis, evanescent rash and other multi organ presentations. Initially, it was described in children by George F.still in 1896¹ Then the disorder was described in adults with similar symptoms by Bywaters in 1971². The annual incidence of AOSD is 0.16 cases per 100000 indusial equally distributed between males and females, With bimodal age distribution between 15-25 years old and 36-45 years³. We present a case of 30 years old female who was diagnosed with Adult-onset Still's disease (AOSD)
